EXERCISE – 12

Question

Execute and display the results of the following Port Scanning commands in Kali Linux Operating System:

1. Basic Port Scan
2. Specific Port Scan
3. All Ports Scan

Aim

To execute and display the results of port scanning commands using Nmap in Kali Linux.**1. 1.BASIC PORT SCAN**

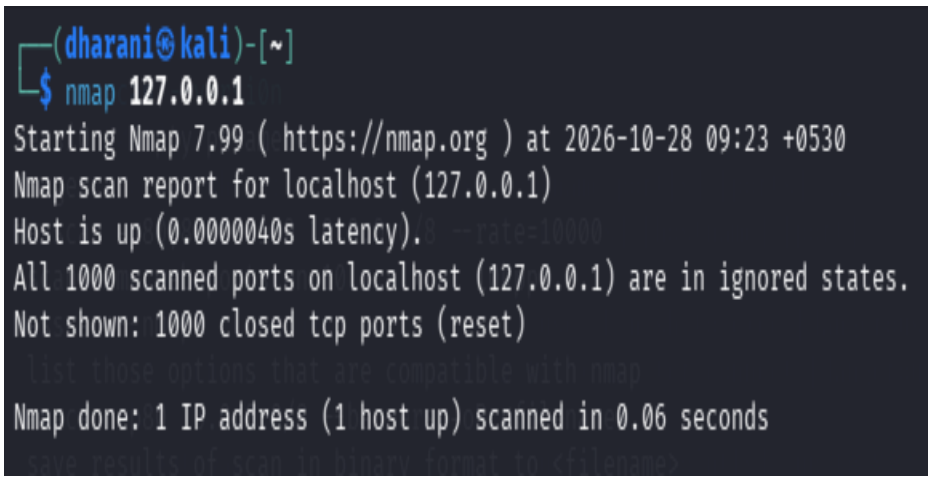

Command:

nmap 127.0.0.1

Use:

The nmap command is used to scan the common ports of the target system and identify open or closed ports.

Output:

2. SPECIFIC PORT SCAN

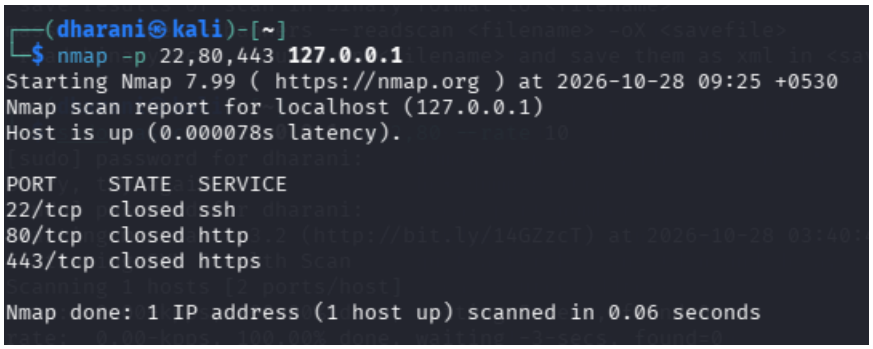

Command:

nmap -p 22,80,443 127.0.0.1

Use:

The -p option is used to scan specific ports and identify their status on the target system.

Output :

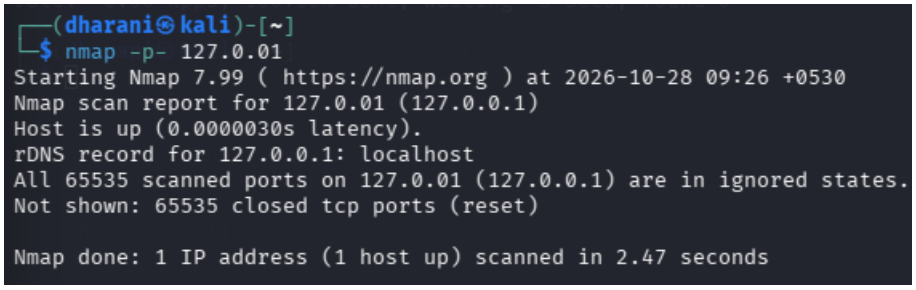

3. ALL PORTS SCAN

Command: nmap -p- 127.0.0.1

Use:

The -p- option is used to scan all 65,535 TCP ports of the target system.

Output:

Result: Port scanning was successfully performed using Nmap on Kali Linux. Open ports and their associated services were identified using basic, specific-port, and all-port scan techniques.
